

For the Phase-I comparisons, we are taking the resistive MHD subset of the Extended MHD equations. They may be written, in MKS units, as follows:

Dimensional Equations:

$$\frac{\partial \vec{B}}{\partial t} = \nabla \times [\vec{V} \times \vec{B} - \eta \vec{J}] \quad \mu_0 \vec{J} = \nabla \times \vec{B}$$

$$nM_i(\frac{\partial \vec{V}}{\partial t} + \vec{V} \bullet \nabla \vec{V}) + \nabla p = \vec{J} \times \vec{B} + \nu \nabla \bullet [\nabla \vec{V} + \nabla \vec{V}^\dagger]$$

$$\frac{\partial n}{\partial t} + \nabla \bullet (n \vec{V}) = 0$$

$$\frac{3}{2} \frac{\partial p}{\partial t} + \nabla \bullet \left(\frac{3}{2} p \vec{V} \right) = -p \nabla \bullet \vec{V} + \nu [\nabla \vec{V} + \nabla \vec{V}^\dagger] : \nabla \vec{V} + \nabla \bullet \kappa \nabla \bullet (p/n) + \eta \vec{J}^2$$

These equations have the energy integral:

$$\frac{\partial}{\partial t} \left(\frac{1}{2\mu_0} B^2 + \frac{1}{2} n M_i V^2 + \frac{3}{2} p \right) = -\nabla \bullet \left(\frac{5}{2} p \vec{V} + \frac{1}{2} n M_i V^2 \vec{V} + \frac{1}{\mu_0} \vec{E} \times \vec{B} - \nu (\nabla \vec{V} + \nabla \vec{V}^\dagger) \cdot \vec{V} - \kappa \nabla (p/n) \right)$$

UNITS:

$$\vec{B} - \text{tesla} = \frac{\text{m}}{\text{s} \bullet \text{coulomb}}$$

$$\vec{V} - \frac{\text{m}}{\text{s}}$$

$$\eta - \text{Ohm-m} = \frac{(\text{kg} \bullet \text{m}^3)}{\text{s} \bullet (\text{coulomb})^2}$$

$$\nu - \frac{\text{kg}}{\text{m} \bullet \text{s}}$$

$$\kappa - \frac{1}{\text{m} \bullet \text{s}}$$

$$\mu_0 - \frac{(\text{kg} \bullet \text{m})}{(\text{coulomb})^2}$$

Dimensionless equations: (Here, $\vec{B}, n, \nabla, \vec{V}, t, p$ are dimensionless variables.)

$$\frac{\partial \vec{B}}{\partial t} = \nabla \times [\vec{V} \times \vec{B} - \hat{\eta} \nabla \times \vec{B}]$$

$$n(\frac{\partial \vec{V}}{\partial t} + \vec{V} \bullet \nabla \vec{V}) + \nabla p = (\nabla \times \vec{B}) \times \vec{B} + \hat{\nu} \nabla \bullet [\nabla \vec{V} + \nabla \vec{V}^\dagger]$$

$$\frac{\partial n}{\partial t} + \nabla \bullet (n \vec{V}) = 0$$

$$\frac{3}{2} \frac{\partial p}{\partial t} + \nabla \bullet \left(\frac{3}{2} p \vec{V} \right) = -p \nabla \bullet \vec{V} + \hat{\nu} [\nabla \vec{V} + \nabla \vec{V}^\dagger] : \nabla \vec{V} + \nabla \bullet \hat{\kappa} \nabla \bullet (p/n) + \hat{\eta} (\nabla \times \vec{B})^2$$

To convert between MKS units and dimensionless units, we need to specify three dimensional quantities. To be specific, let: $B_0 = 1$ tesla, $n_0 = 10^{20} m^{-3}$, $\ell_0 = 1$ m. Then, the conversion from the dimensionless to dimensional quantities are:

Velocity: $V_0 = V_A \equiv \left(\frac{B_0^2}{\mu_0 n_0 M_i} \right)^{1/2} = 2.1812 \times 10^6 \text{ m/s}$

time: $t_0 = \frac{\ell_0}{V_A} = 4.58 \times 10^{-7} \text{ s}$

pressure: $p_0 = \frac{B_0^2}{\mu_0} = 7.957 \times 10^5 \text{ pascals}$

resistivity: $\eta = \mu_0 \ell_0 V_A \times \hat{\eta} = 2.739 \times \hat{\eta}$

viscosity: $\nu = \ell_0 n_0 M_i V_A \times \hat{\nu} = 0.364 \times \hat{\nu}$

thermal conductivity: $\kappa = \ell_0 V_A n_0 \times \hat{\kappa} = 2.186 \times 10^{26} \times \hat{\kappa}$

kinetic energy: $M_i n_0 V_0^2 = 7.957 \times 10^5 \text{ J/m}^3$

Problem Definition:

Dimensionless/Dimensional problem specification is as follows:

	<i>Dimensionless</i>	<i>Dimensional</i>
$L_x/2 < x < L_x/2$	$L_x = 25.6$	$L_x = 25.6 \text{ m}$
$L_y/2 < y < L_y/2$	$L_y = 12.8$	$L_y = 12.8 \text{ m}$
$\psi(x, y) = \psi_0 \left[\begin{array}{l} \frac{1}{2} \ln(\cosh 2y) \\ + 0.1 \cos\left(\frac{2\pi x}{L_x}\right) \cos\left(\frac{\pi y}{L_y}\right) \end{array} \right]$	$\psi_0 = 1$	$\psi_0 = 1 \text{ Tesla/m}^2$
$p(x, y) = \frac{p_0}{2} (\operatorname{sech}^2(2y) + 0.2)$	$p_0 = 1$	$p_0 = 7.957 \times 10^5 \text{ pascals}$
$n(x, y) = n_0 (\operatorname{sech}^2(2y) + 0.2)$	$n_0 = 1$	$n_0 = 1 \times 10^{20} \text{ m}^{-3}$
resistivity	$\hat{\eta} = 0.005$	$\eta = 0.0137 \text{ Ohm-m}$
viscosity	$\hat{\nu} = 0.050$	$\nu = 0.0182 \text{ kg/m-s}$
thermal conductivity	$\hat{\kappa} = 0.02$	$\kappa = 4.37 \times 10^{24} \text{ m}^{-1}\text{-s}^{-1}$

To compare the kinetic energies, we need to multiply the dimensionless one by the conversion factor $7.957 \times 10^5 \text{ J/m}^3$
