More Fireflies

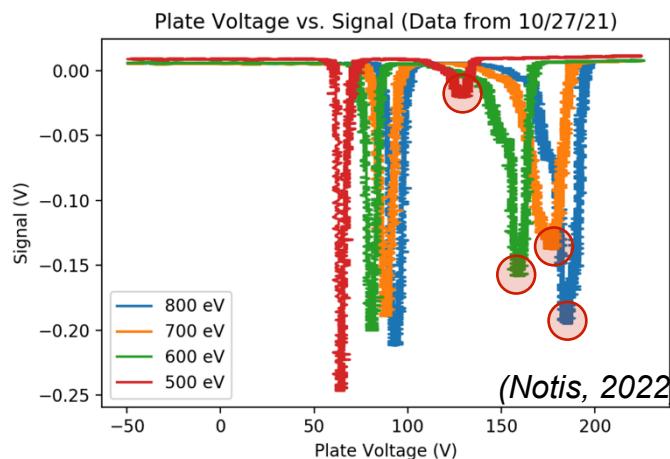

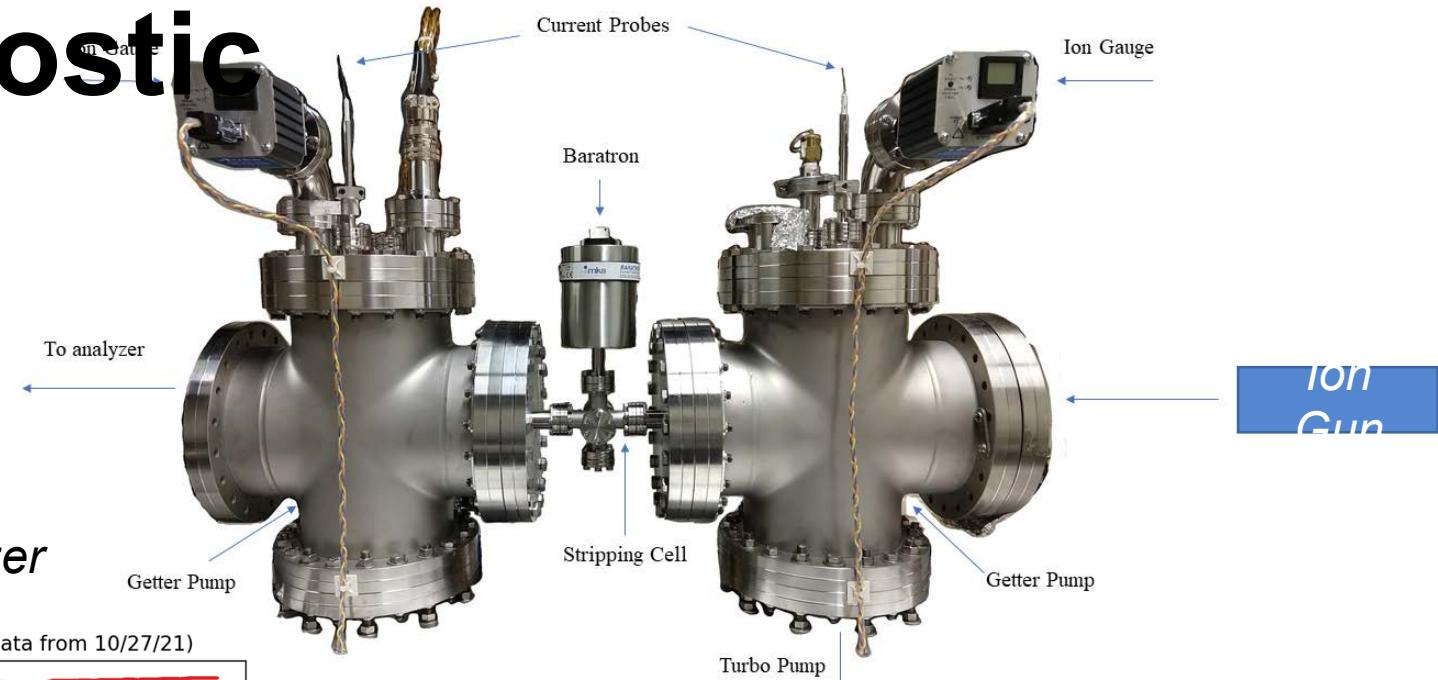

Ion Energy Analyzer

Diagnostic

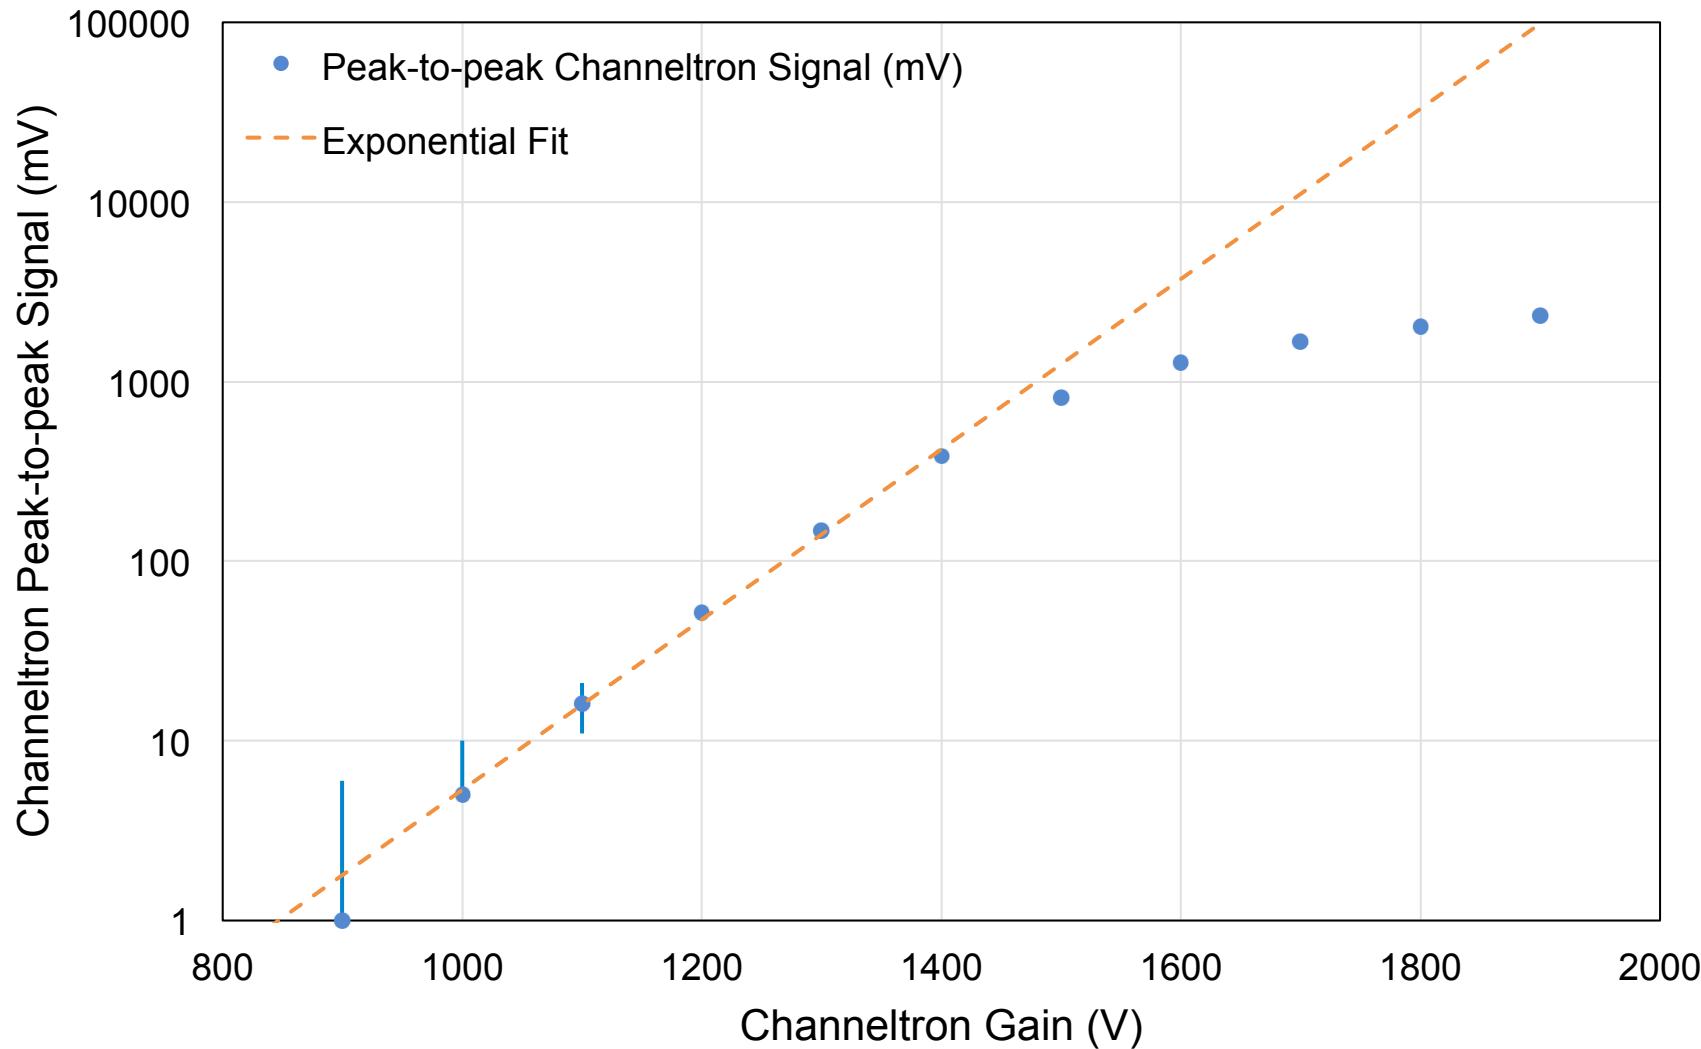

Curved-plate analyzer

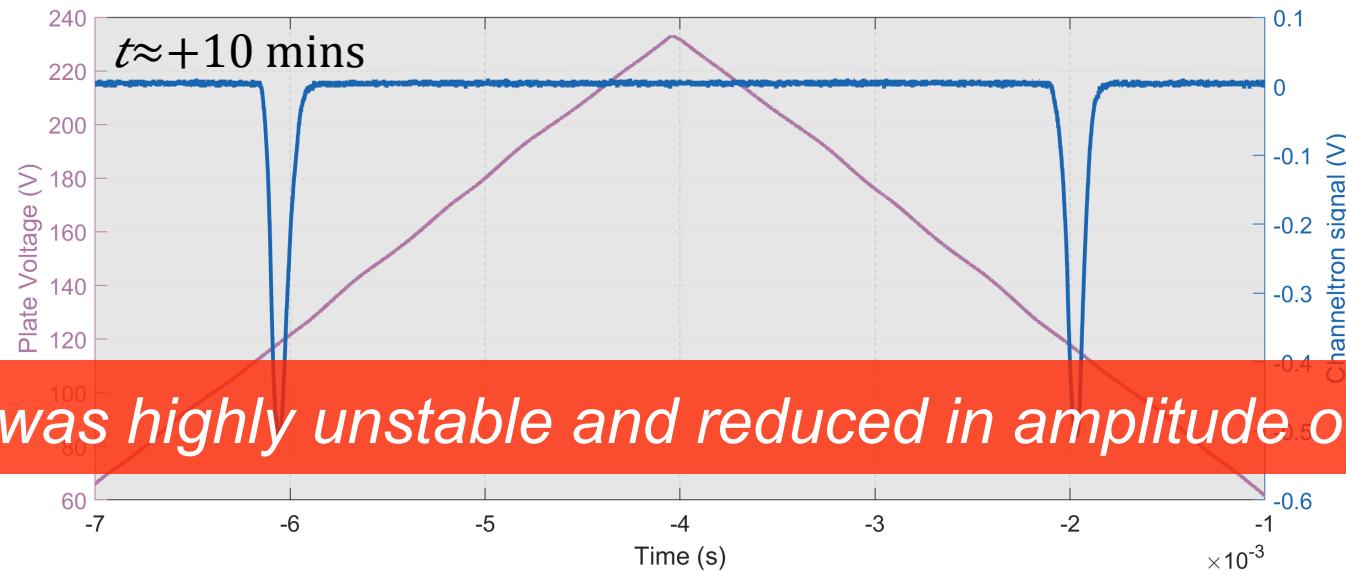

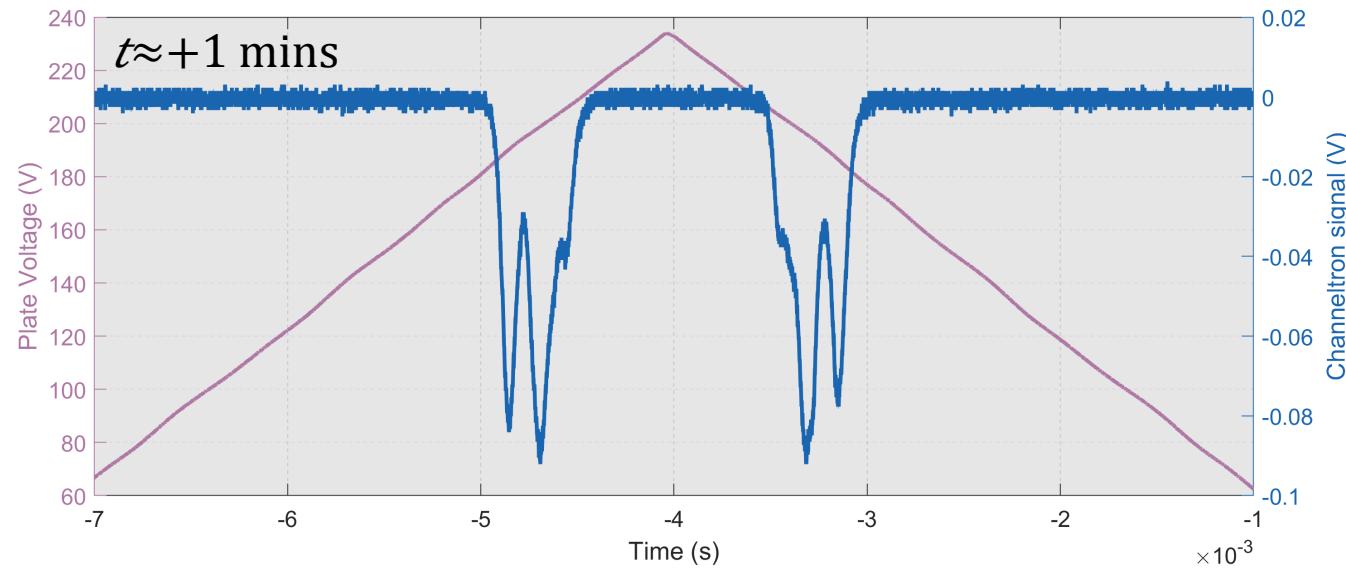

Unexpected 2nd energy peak

Goal: Reproduce Noah's experiment and investigate origins of this peak

Varying Channeltron Gain

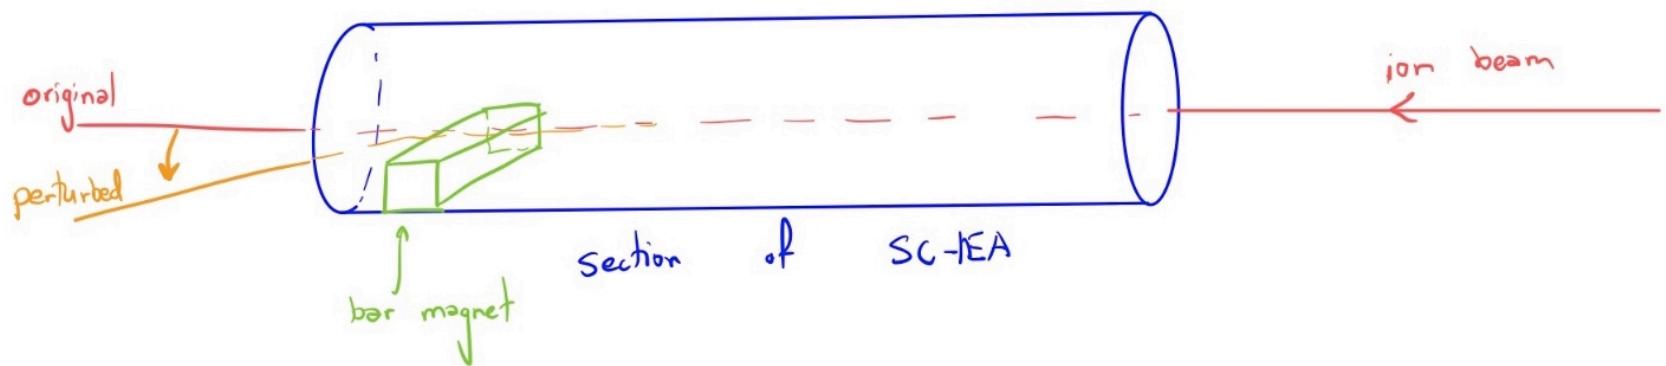

Observations from Initial Run

Signal was highly unstable and reduced in amplitude over time

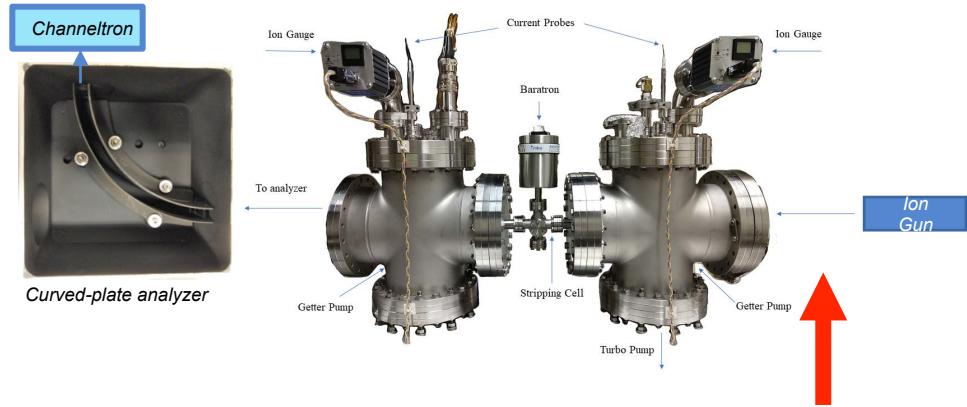

Using external B-field to deflect signal

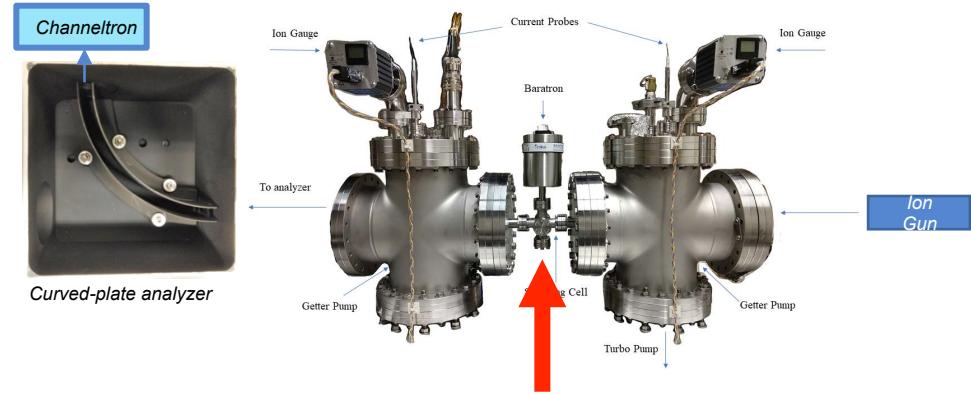

Move bar magnet closer and further on different sections of the SC-IEA to deflect ion beam

Informs us of misalignments if signal gets stronger

Using external B-field to deflect signal

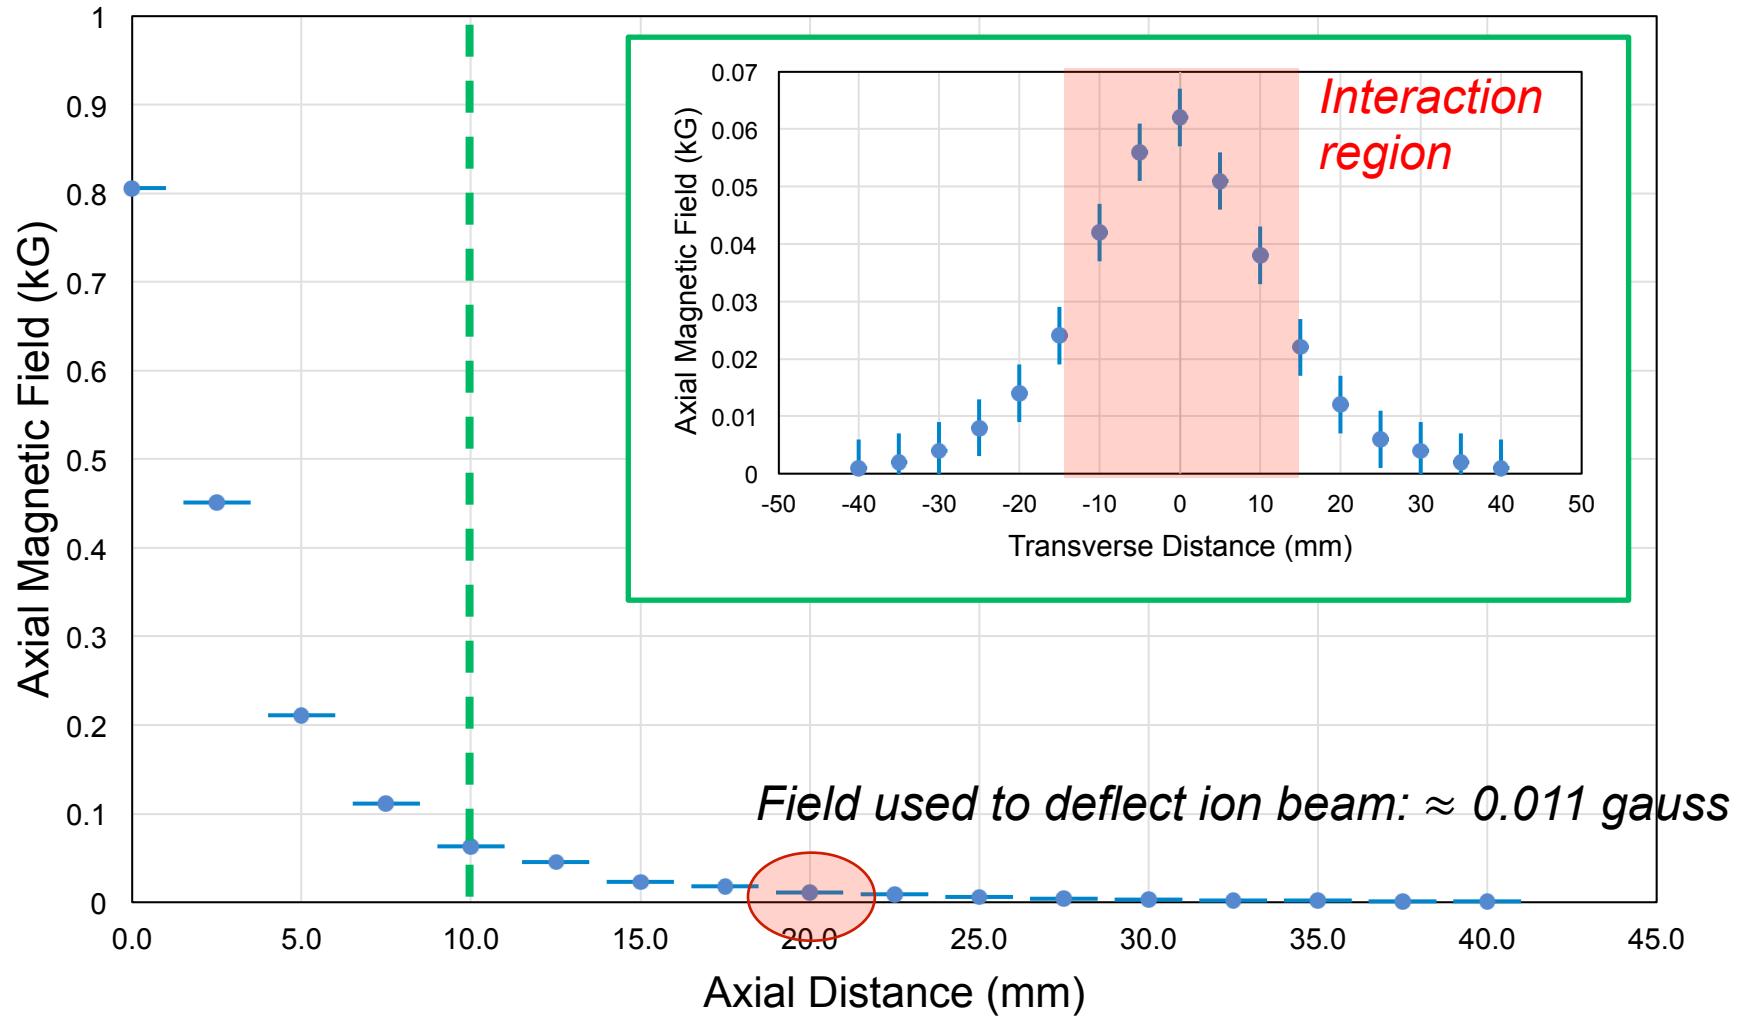

Using external B-field to deflect signal

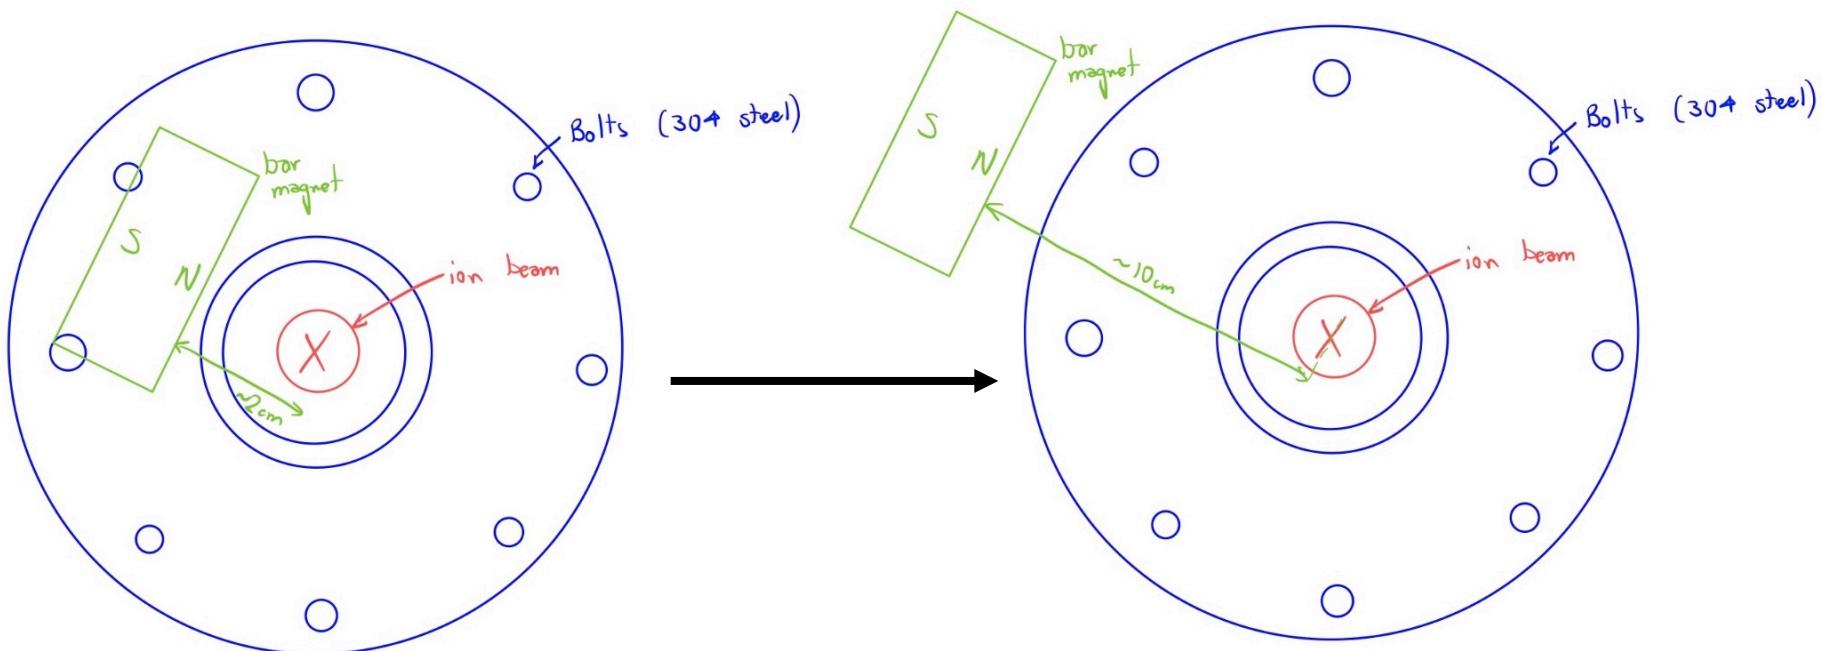

When magnet was taken away, the signal did not return to original magnitude

Mapping out permanent magnet

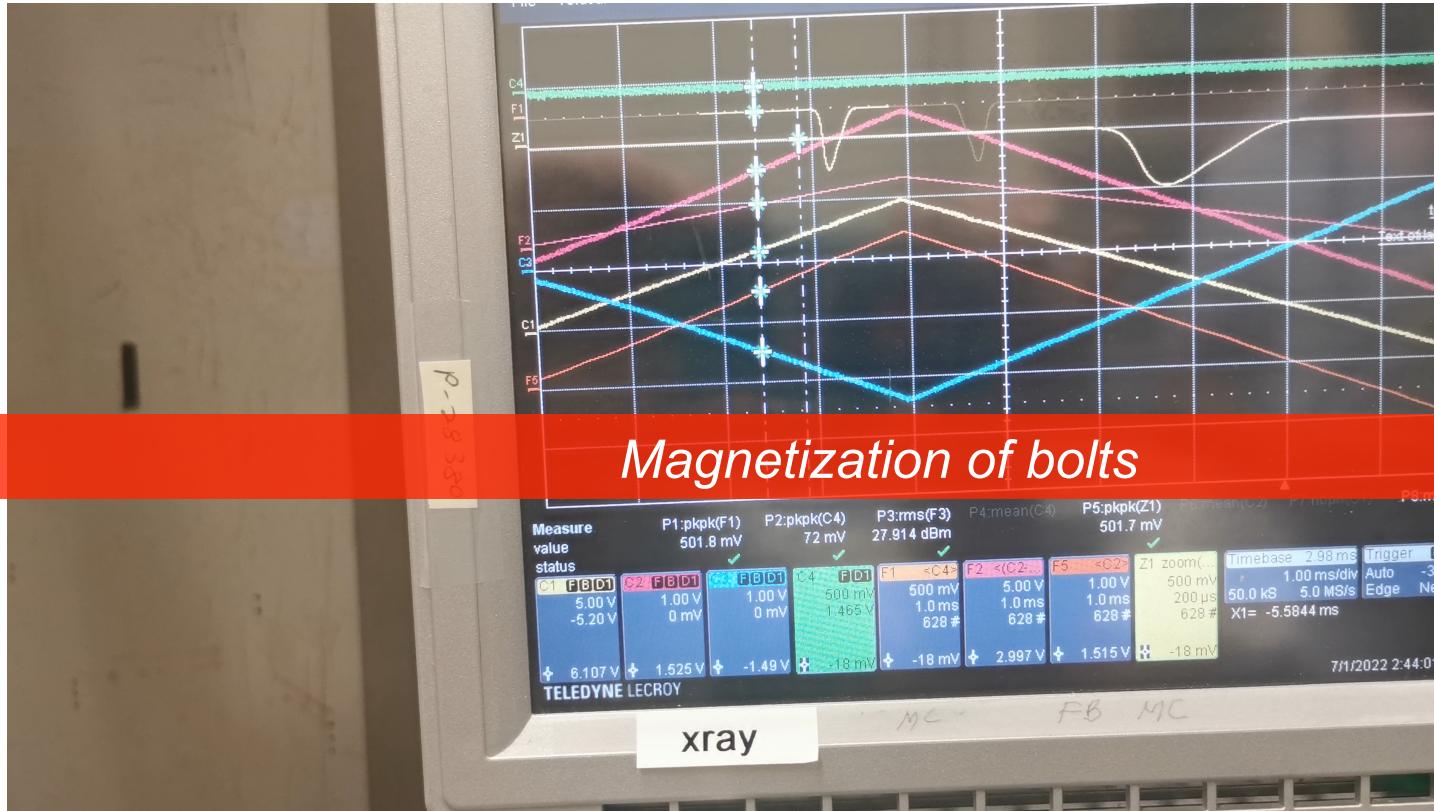

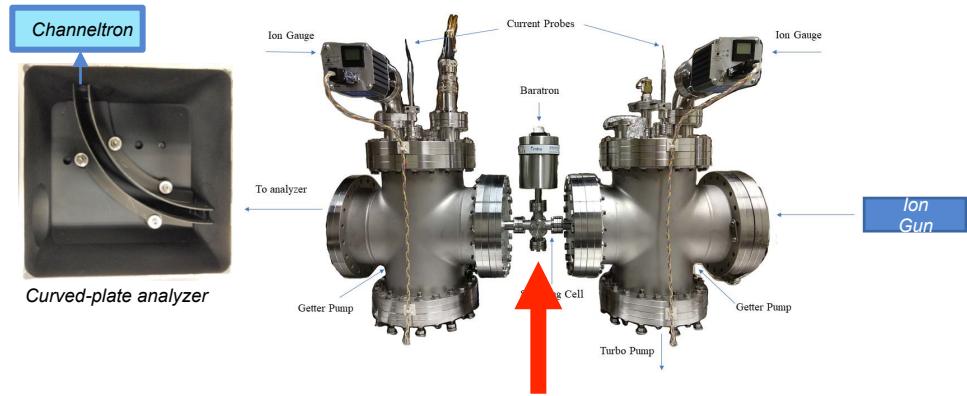

Mapping out permanent magnet field

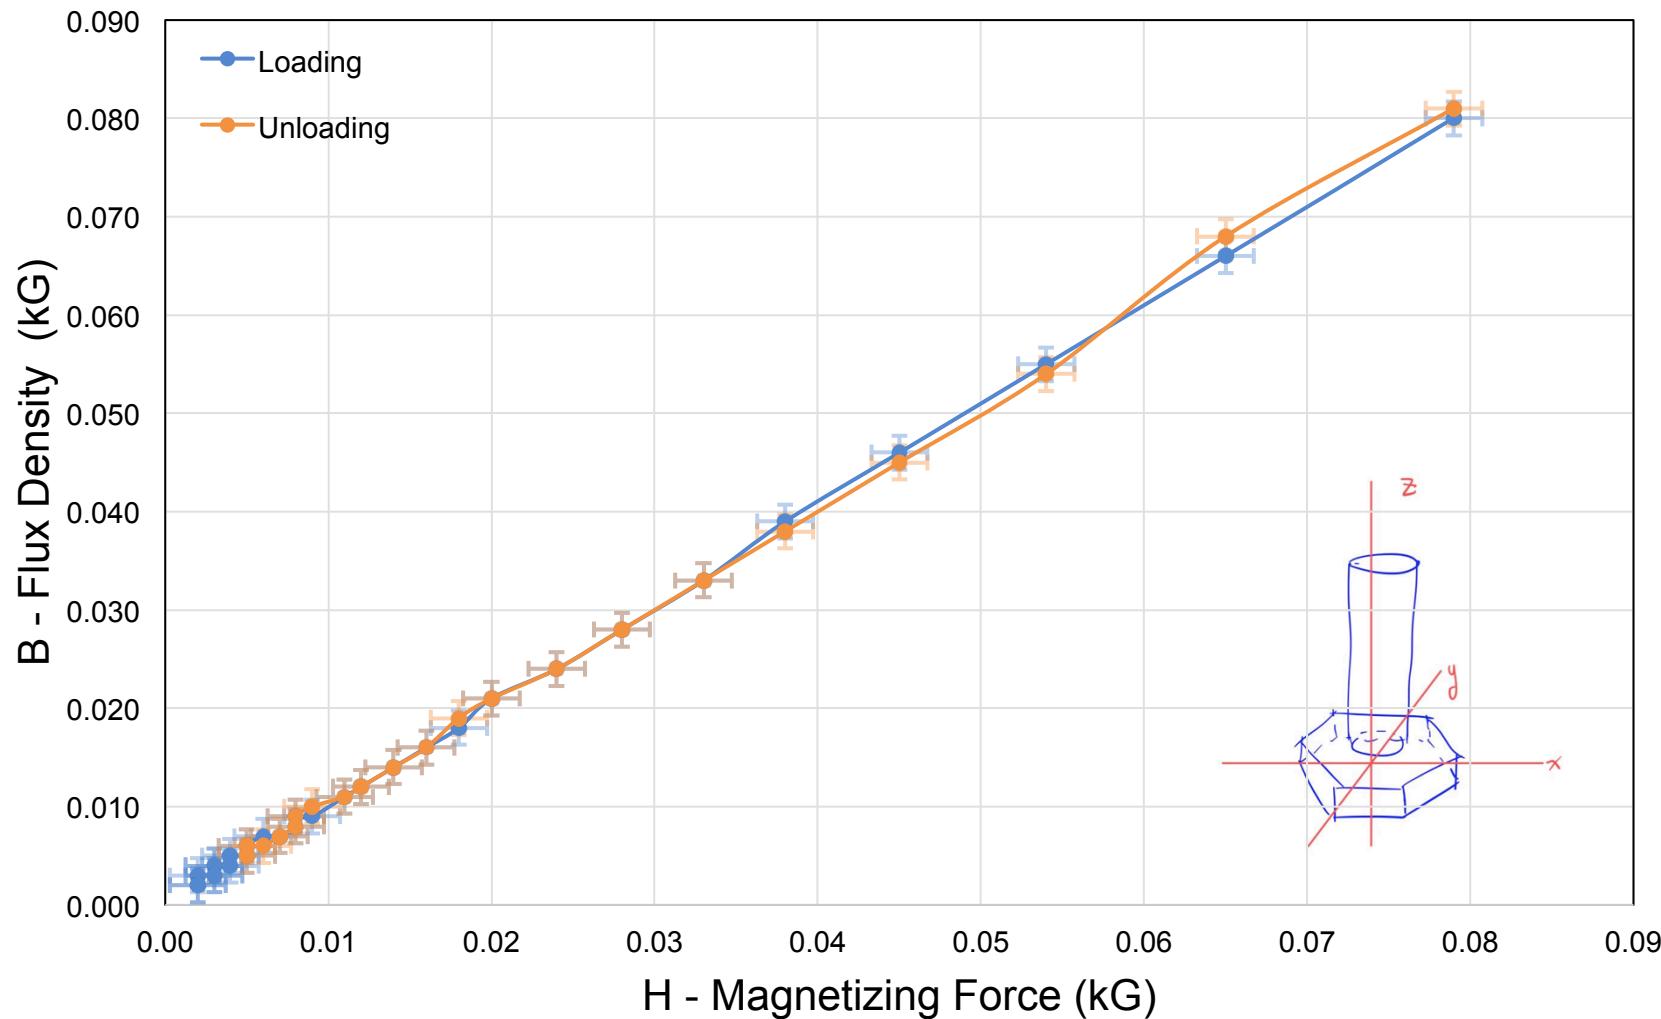

*Magnetic field is near negligible
at this distance*

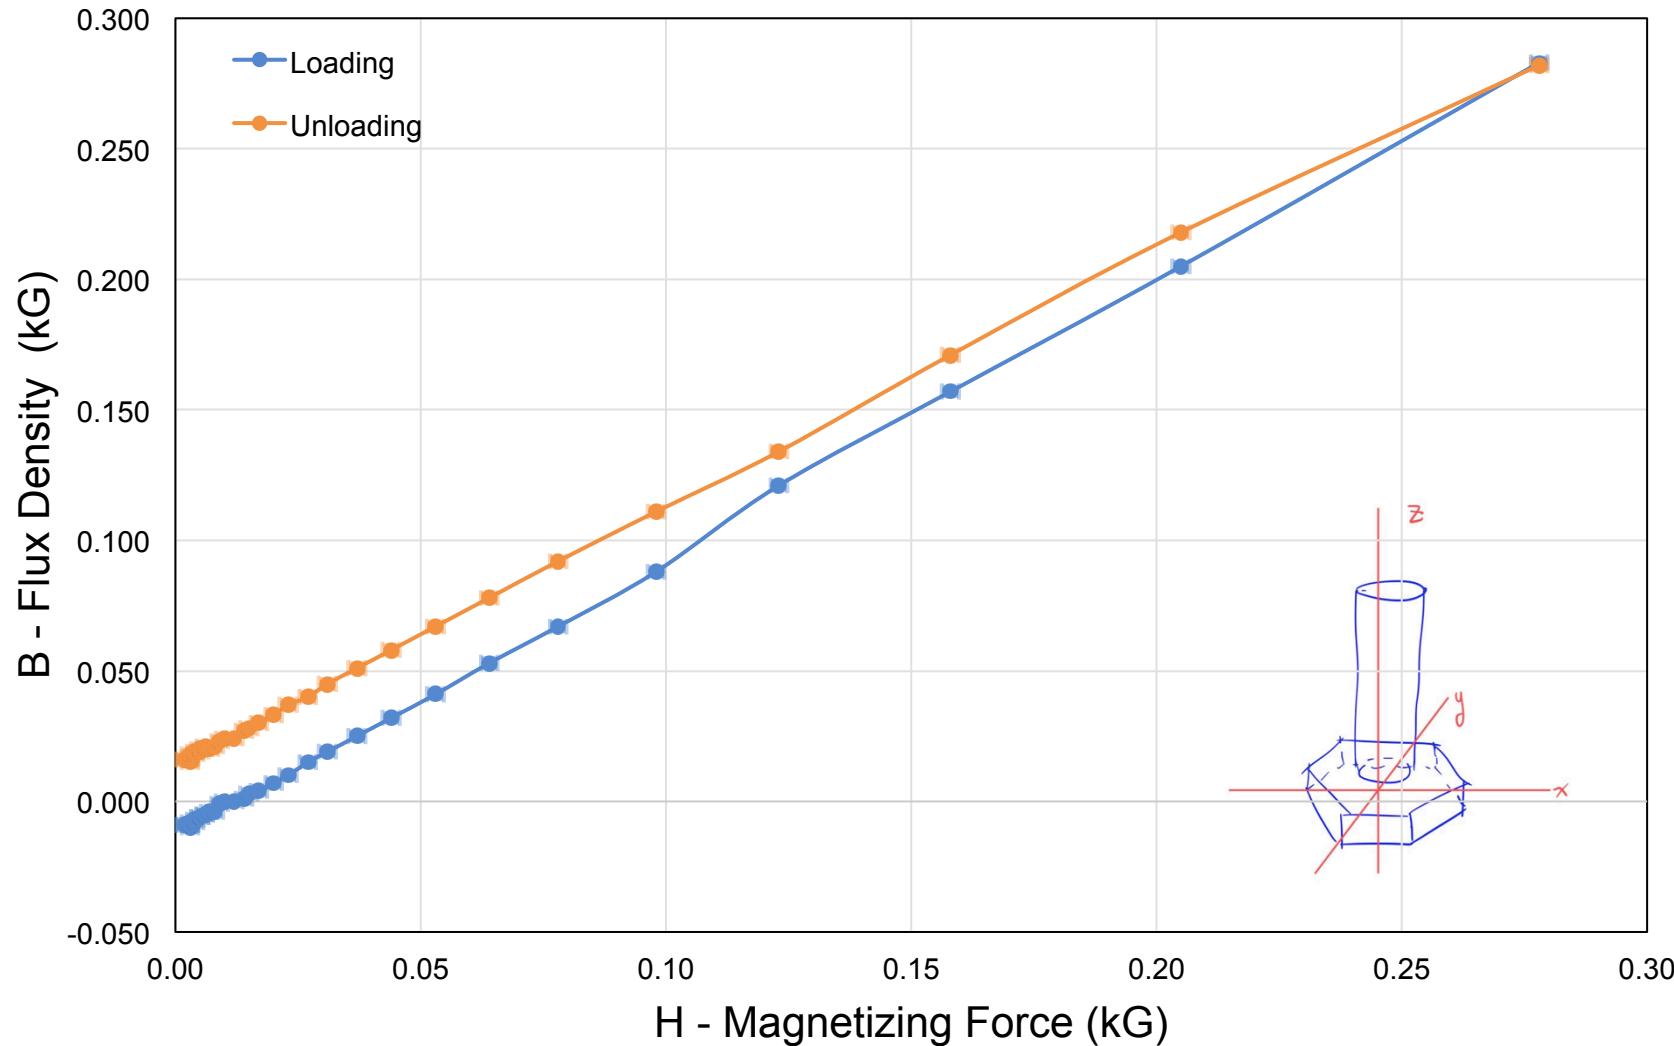

Using external B-field to deflect signal

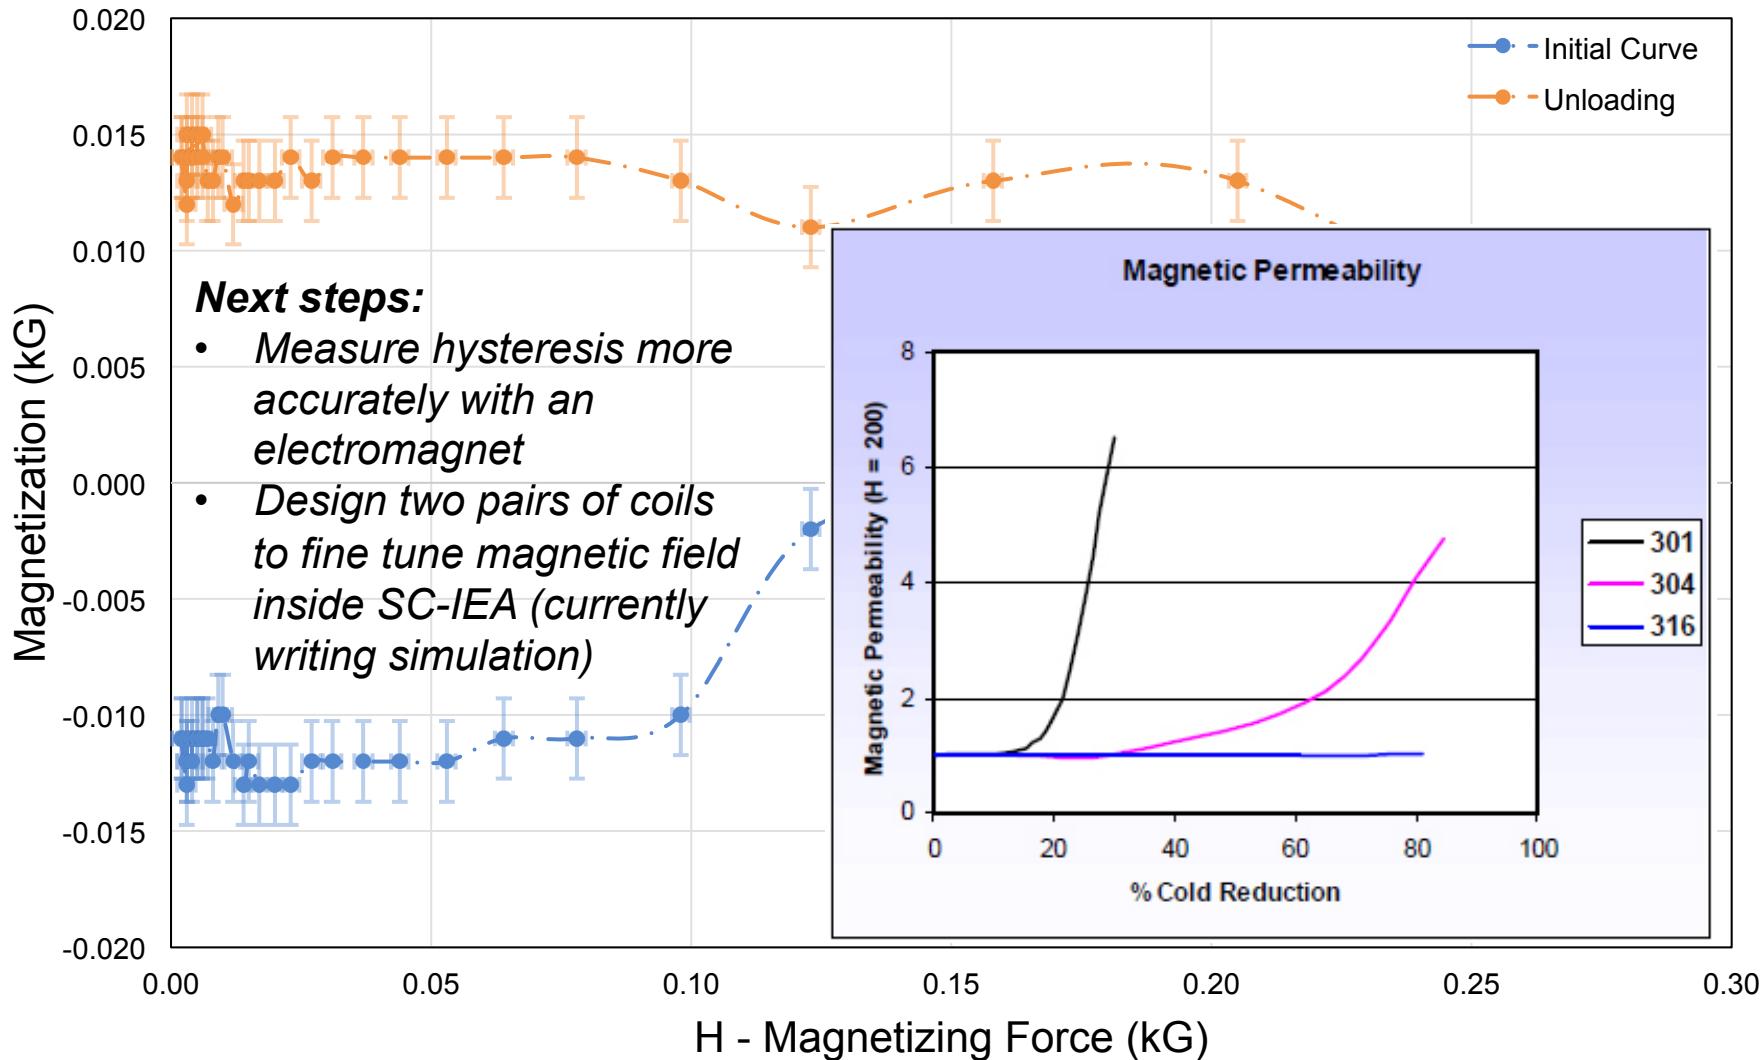

Z-directional hysteresis

X-directional hysteresis

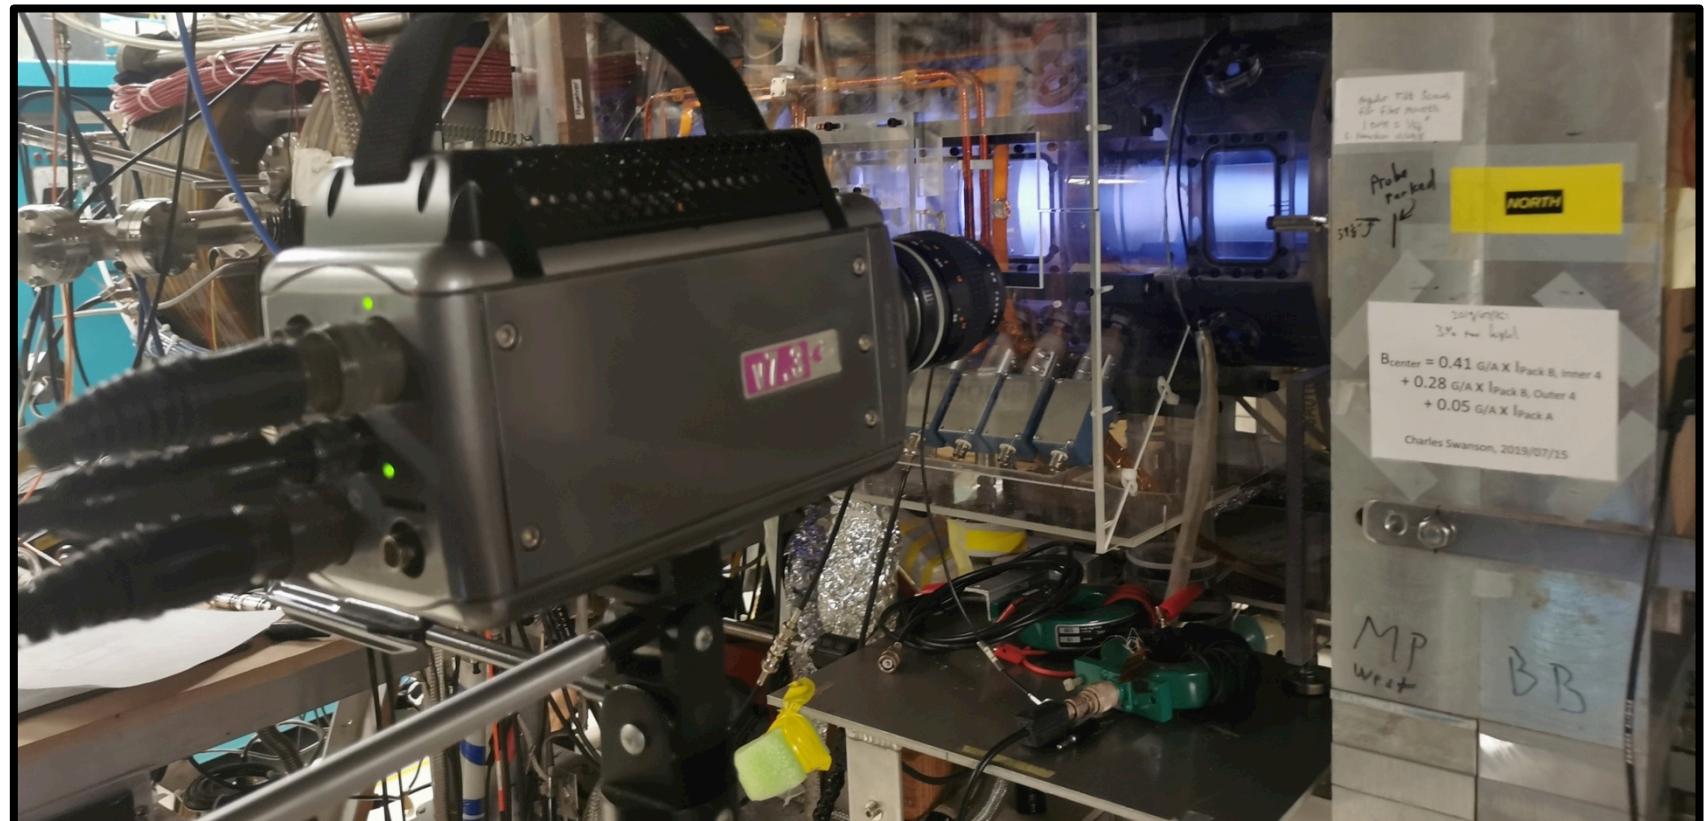

X-directional hysteresis

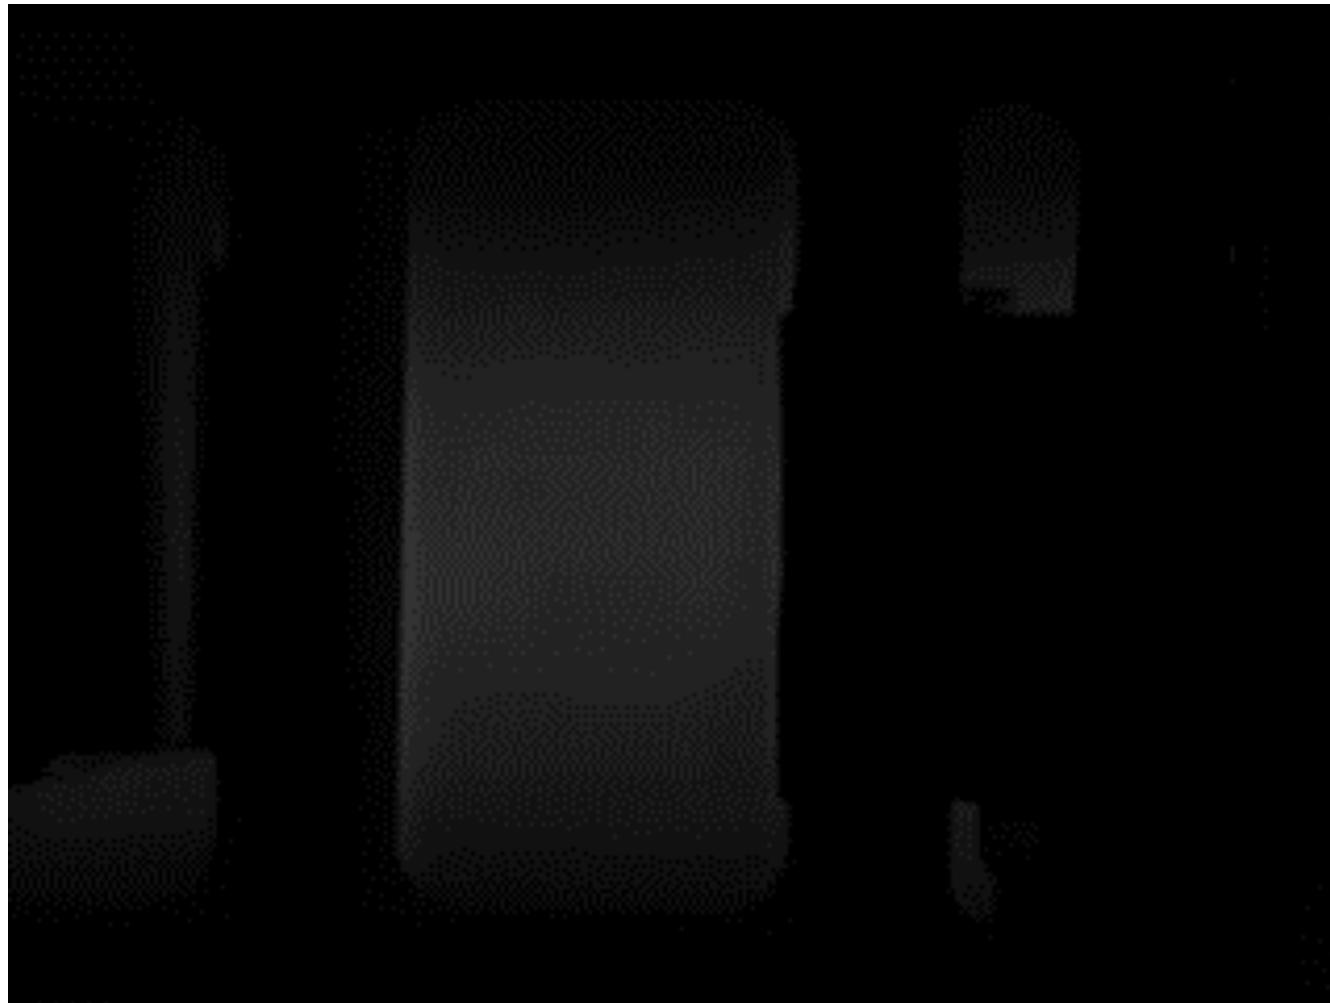

Phantom Camera

Images taken with a traditional camera is a time-average over many rotations of the plasma

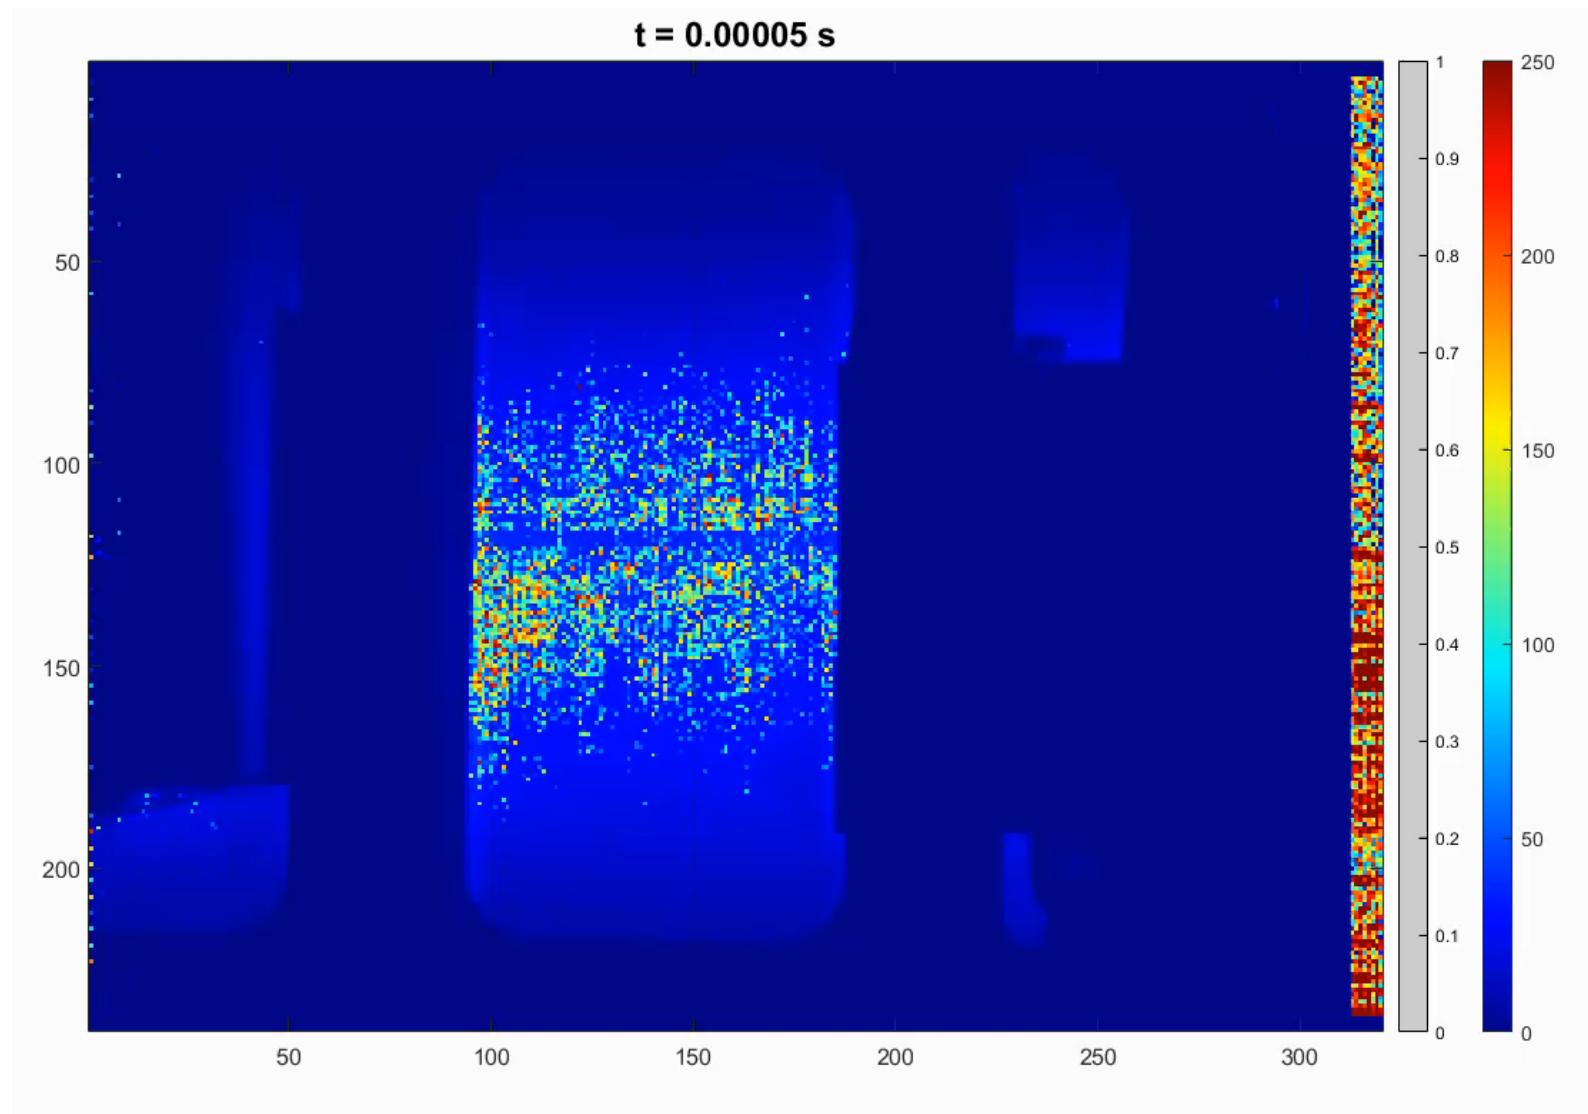

Leads to errors in the Abel inversions for electron distributions

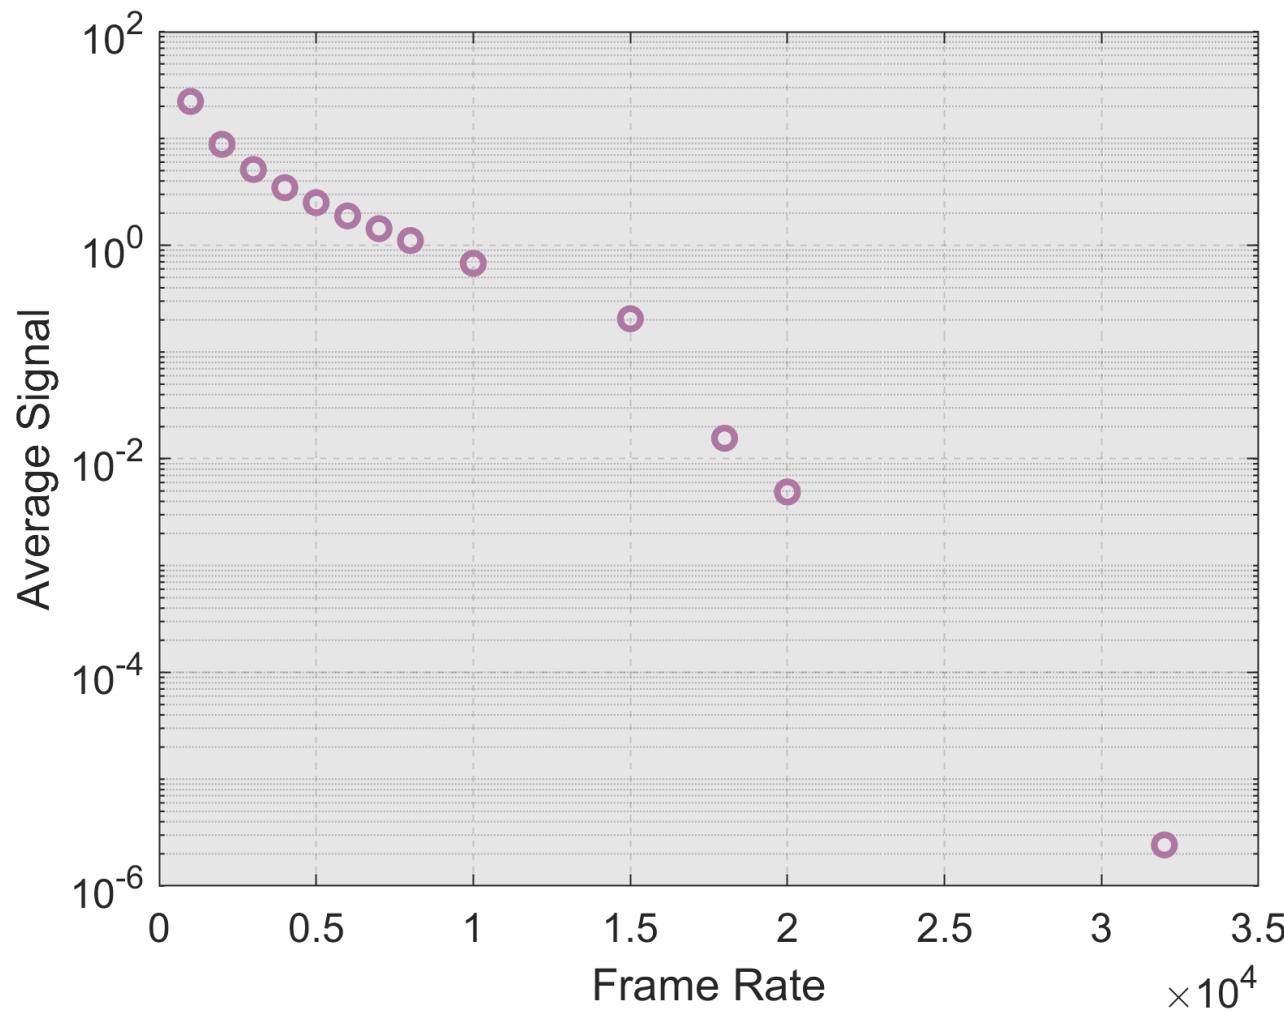

Phantom Camera @ 1k fps

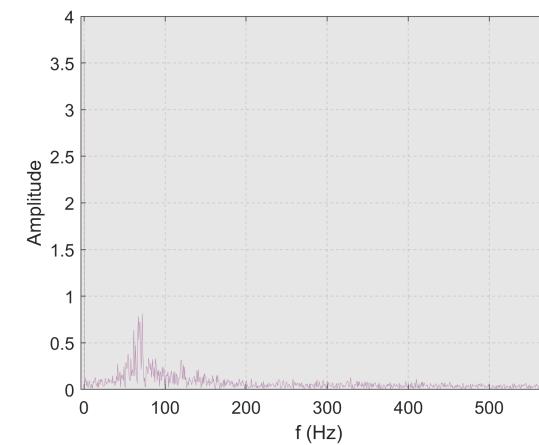

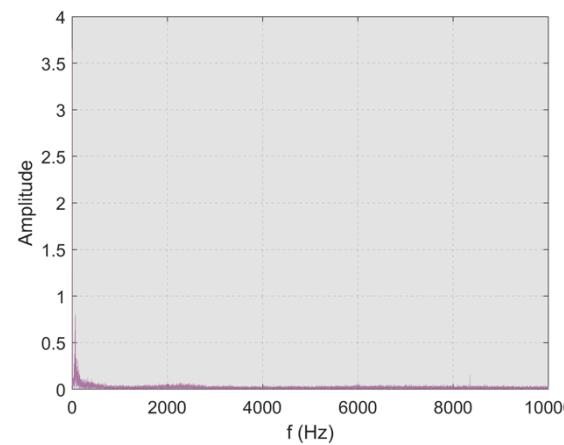

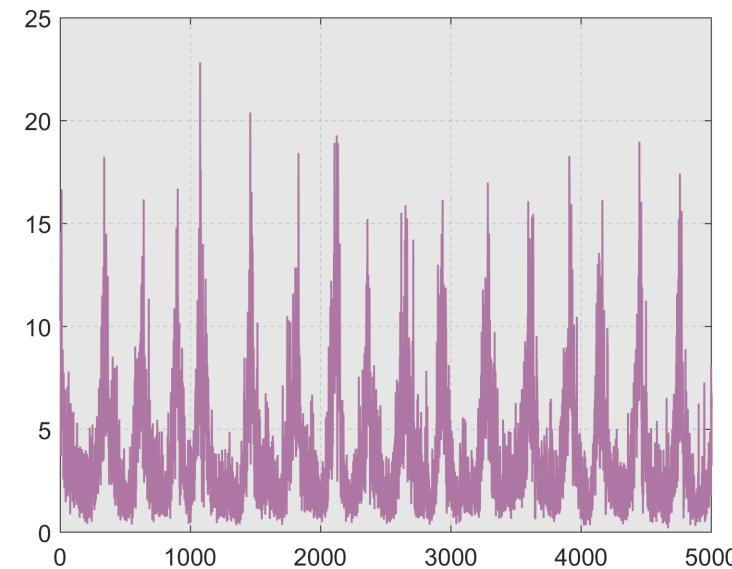

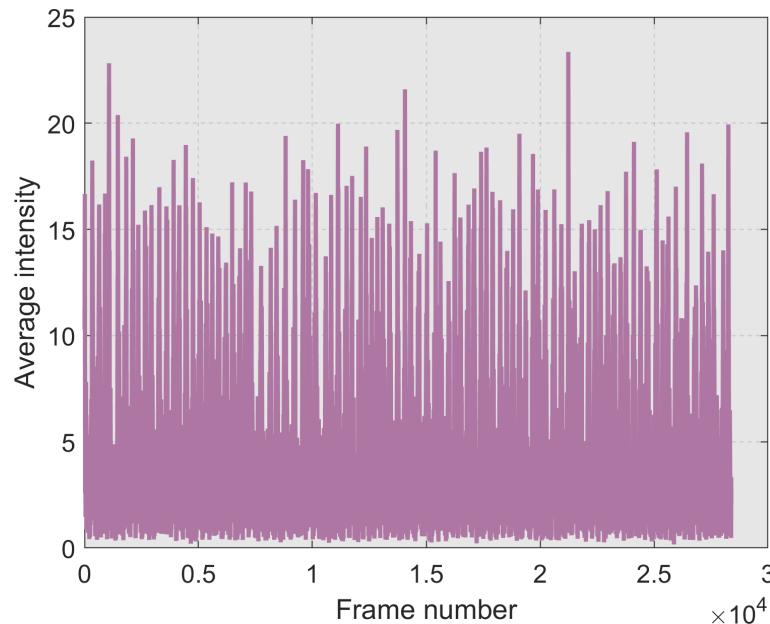

Phantom Camera @ 20k fps

Phantom Camera SNR

Phantom Camera @ 20k fps

Phantom Updates and Next Steps

~~Each file is ~20 GB~~

- *Finished batch processing 20 files from yesterday and setting up a hard drive to temporarily store files*
- *Beam position vs. time*
- *Beam width vs. time*
- *Background noise estimation vs. frame rate*
